Amendments to the Specification:

Please replace the paragraph beginning on page 5, line 7 with the following amended paragraph:

The programmable switch 16 receives a control signal 32 which may be, for example, any suitable control information such as a bit in a programmable register containing bits for other switching control, or any other suitable control signal. The control signal activates the programmable switch 16 to switch[[-]]scaled video 18 to either of the two video overlay generators 20a and 20b. The programmable switch also provides other switching as further described below.

Please replace the paragraph beginning on page 7, line 15 with the following amended paragraph:

The selectable video clock source 202 includes a multiplexer which serves as a programmable switch to provide switching between a plurality of display-dependent clock signals 204 and 208. These signals are display-dependant since they may vary depending upon which display is selected to display the overlaid video. For example, if a selected display has a higher refresh rate than another display, the clock signal 204 and 208 may be different, and as such the single video clock signal 38 is switched to be equal to one of the differing clocks 204 and 208.
